## 6. STUDY PARAMETERS

**Test Species and strain:** Honey bees (*Apis mellifera*)

**Age of Test Organisms at Test Initiation:** 1<sup>st</sup> instar larvae, 72-hours post-hatch

**Exposure Duration:** 48 hours

## 7. CONCLUSIONS:

Individual synchronized honey bee (*Apis mellifera*) larvae (newly hatched) were exposed *in vitro* to Acetochlor Technical on Day 4 of the study at the nominal dietary concentrations and doses reported in the table below. Measured diet concentrations and dietary doses were calculated by the study author based on the analyzed diet samples and are also summarized below.

Nominal Concentration (mg ai/kg diet)	Measured Concentration (mg ai/kg diet)	Nominal Dietary Dose (µg ai/larva)	Measured Dietary Dose (µg ai/larva)
183	181	6.3	6.19
366	359	13	12.3
732	716	25	24.5
1460	1438	50	49.2
2920	2871	100	98.2

Larvae used in the study were obtained from the test facilities' own supply (Alachua, FL). A negative control was run, and dimethoate (purity: 98.3%) was used as a reference toxicant at 257 mg ai/kg diet, corresponding to a nominal dose of 8.8 µg ai/larva. All groups consisted of 3 replicates with 12 larvae/replicate for a total of 36 larvae per treatment and control group, placed within 48-well cell culture plates. Each of the three separate colonies was considered to be a replicate.

After 72 hours, there was an absence of mortality in the negative control and lowest test level. Mortality ranged from 3 to 97% in the four highest test levels, with mortality increasing notably from one level to the next in the three highest test levels. On Day 7, unconsumed diet was noted in 3, 0, 6, 13, 71, and 100% of surviving bees in the negative control and measured 6.19, 12.3, 24.5, 49.2, and 98.2 µg ai/larva treatment groups, respectively. The dimethoate treatment resulted in 61% mortality. Based on these results, the 72-hr LC<sub>50</sub> was determined to be 1316 mg ai/kg diet, and the 72-hr LD<sub>50</sub> was 45.0 µg ai/larva.

The study is **scientifically sound** and is classified as **supplemental** for measuring acute (single dose) toxicity to honey bee larvae.

	Mortality
Diet Concentration (mg ai/kg diet)	LC <sub>50</sub> : 1316 95% CI: 1127 - 1528 Slope: 5 (3 - 6)
Dietary Dose (µg ai/larva)	LD <sub>50</sub> : 45.0 95% CI: 38.5 - 52.3 Slope: 4.8 (3.4 – 6.3)

## 8. ADEQUACY OF THE STUDY

**A. Classification:** This study is **scientifically sound** and is classified as **supplemental (quantitative)**.

**B. Rationale:**

**C. Repairability:**

**9. GUIDELINE DEVIATIONS:** The test was performed in accordance with the OECD Guidance Document 237 on Honey bee (*Apis mellifera*) Larval Toxicity Test, Single Exposure (2013). The following deviations were noted:

1. The replicates in this experiment were defined as a colony consisting of 12 bees. Individual bee data were not reported as recommended by the EPA's Honeybee Toxicity Testing Frequently Asked Questions (August 16, 2018) where a replicate is defined as the individual bee present in each individual grafting cell.
2. Incomplete physiochemical properties of the test item were reported.
3. The shape of the grafted larvae at transfer was not reported. OECD recommends that newly hatched larvae are selected that have not yet formed a "C" shape.
4. It was not reported if colonies were kept in conditions conforming to proper cultural practices.
5. The % weight of yeast, glucose, and fructose are representative of the total diet weight, not the OECD recommended % of aqueous solution. Further details were not provided for the reviewer to calculate % weight of the aqueous solution for these components.
6. Raw data for environmental conditions (temperature and relative humidity) were not reported, and results were only provided as an average for the entire study period.

**10. SUBMISSION PURPOSE:** To determine the effects on mortality and sublethal effects of Acetochlor Technical on the honey bee (*A. mellifera* L.) larvae from acute [single dose] exposure for the purpose of pesticide re-registration.

**11. MATERIALS AND METHODS****A. Test Material**

Test Material: Acetochlor Technical  
 Description: Light yellow liquid  
 Lot No./Batch No.: 20180139  
 Purity: 96.6%

Stability of compound under test conditions. Analytical verification of the test item in larval Diet C samples resulted in recoveries ranging from 97% to 101% of nominal values.

Storage conditions of test chemical: Ambient.

**Physicochemical properties of Acetochlor Technical:**

Parameter	Values	Comments
Molecular Weight	Not reported	
Water solubility at 20°C (mg/L)	Not reported	
Vapor pressure (torr, at 25°C)	Not reported	
Structure	Not reported	
Mean organic carbon partition coefficient $K_{oc}$ (L/kg <sub>oc</sub> )	Not reported	
Log octanol-water partition coefficient Log $K_{ow}$	Not reported	

**B. Test Organisms**

Guideline Criteria	Reported Information	Comments
Species	Honey bee ( <i>Apis mellifera</i> )	<i>OECD recommends European honey bee (Apis mellifera)</i>
Age at beginning of test Worker bees of uniform	Newly hatched larvae (72-hours post-hatch).	

Guideline Criteria	Reported Information	Comments
age.		<i>OECD recommends that on D1 of study, first instar (L1) synchronized larvae (i.e., larvae of the same age) are taken from comb of three colonies.</i>
Source	Test facilities' own supply (Alachua, FL). Larvae were from three different hives.	<i>OECD recommends larvae are collected from three different colonies.</i>
Were bees from disease-free colonies?	Larvae for the test were selected from brood frames collected from adequately fed, apparently healthy hives. Larvae were not treated with antibiotics, miticides, or other pesticides within the previous four weeks.	<i>OECD recommends that colonies used to obtain larvae should be adequately fed, health (i.e., as far as disease- and parasite-free), with a known history and physiological status.</i>
Were bees kept in conditions conforming to proper cultural practices?	Not reported. Larvae were from hives with a known history of apicultural practices.	

## B. Test System

Guideline Criteria	Reported Information	
Test Chambers	Larvae were grafted into polystyrene cell cups (9 mm x 8 mm) containing artificial diet. Cells cups were placed in 48-well tissue culture plates and covered with lids. The grafting cell cups were positioned at the top of a cotton dental roll placed in each well. The larvae were held in a hermetically sealed plexiglass desiccator.	<i>OECD recommends 48-well plate with each well containing a crystal polystyrene grafting cell.</i>

Guideline Criteria	Reported Information	
<b>Temperature during exposure</b>	Average of 34.8°C. Variations in temperature were only observed when the desiccator was opened for grafting and feeding.	<i>OECD recommends incubator at 34 – 35°C. Deviations may occur but temperature should not be lower than 23°C or higher than 40°C; deviations not last more than 15 minutes once every 24 hrs.</i>
<b>Relative humidity during exposure</b>	Average of 92.3%. A saturated potassium sulfate solution was placed in the incubator to help maintain relative humidity. Variations in relative humidity were observed when the desiccator was opened for grafting and feeding.	<i>OECD recommends use of <math>K_2SO_4</math> to maintain water saturated atmosphere.</i>
<b>Lighting</b>	Bees maintained in the dark except during dosing and observations.	<i>OECD recommends that plates should be maintained in darkness.</i>
<b>Feeding</b>	<p>Each larva was fed once a day (except on D2) with a standardized amount of artificial diet: 20 µL untreated diet A on day 1 (D1), 20 µL untreated diet B on day 3 (D3), 30 µL treated/untreated diet C on day 4 (D4), 40 µL untreated diet C on day 5 (D5), and 50 µL untreated diet C on day 6 (D6).</p> <p>Unused diet C was stored refrigerated between feeding intervals.</p> <p><u>Diet A*</u>: 44.25% weight of fresh royal jelly + 44.25% weight of water + 0.90% weight of yeast</p>	<p>*The % weight of yeast, glucose, and fructose are representative of the total diet weight, not the OECD recommended % of aqueous solution. Further details were not provided for the reviewer to calculate % weight of the aqueous solution for these components.</p> <p><i>OECD recommends that all larvae are fed once a day. Volume of diet is adjusted each day. Additional food should be added to the cell even if previous allocation has not been totally consumed. Presence of uneaten food at termination of test should be reported.</i></p> <p><i>OECD recommends: Diet A (D1): 50% weight of fresh royal jelly + 50% weight of an</i></p>

Guideline Criteria	Reported Information	
	<p>extract + 5.30% weight of glucose and 5.30% weight of fructose.</p> <p><u>Diet B*</u>: 42.95% weight of fresh royal jelly + 42.95% weight of water + 1.30% weight of yeast extract + 6.40% weight of glucose and 6.40% weight of fructose.</p> <p><u>Diet C*</u>: 50% weight of fresh royal jelly + 30% weight of water + 2.0% weight of yeast extract + 9.0% weight of glucose and 9.0% weight of fructose.</p>	<p><i>aqueous solution containing 2% weight of yeast extract, 12% weight of glucose</i></p> <p><i>Diet B (D3): 50% weight of fresh royal jelly + 50% weight of an aqueous solution containing 3% weight of yeast extract, 15% weight of glucose and 15% weight of fructose. and 12% weight of fructose.</i></p> <p><i>Diet C (from D4 to D6): 50% weight of fresh royal jelly + 50% weight of an aqueous solution containing 4% weight of yeast extract, 18% weight of glucose and 18% weight of fructose.</i></p>

### C. Test Design

Guideline Criteria	Reported Information	Comments
<b>Nominal dosage levels tested</b>	<p><u>Diet concentrations</u>: 0 (negative control), 183, 366, 732, 1460, and 2920 mg ai/kg diet</p> <p><u>Dietary Doses</u>: 0 (negative control) 6.3, 13, 25, 50, and 100 µg ai/bee</p>	<p><i>OECD recommends 5 treatments of increasing test concentrations. Alternatively, when a limit test is performed, a single dose of 100 µg ai/larva or the maximum achievable solubility (whichever is lower).</i></p>
<b>Number of bees exposed per dosage level</b>	12 bees per replicate, with 3 replicates per test level. 36 total bees per group. Each of three different hives was considered to be a replicate.	<p><i>OECD recommends minimum of 12 larvae from each of 3 colonies allocated on the same plate to each treatment, i.e., minimum of 36 larvae per treatment.</i></p>
<b>Other experimental</b>	To ensure the production of	

Guideline Criteria	Reported Information	Comments
<b>design information</b>	<p>uniform larvae, the queen from each hive was confined in an excluder for 24 to 26 hours on an empty frame of drawn comb in order to isolate the potential area for egg laying. After the egg-laying period, the queens were released and the frames with eggs were kept in the hive near the brood for approximately 75 hours, until the larvae hatched and reached an appropriate size for transfer.</p> <p>More larvae than were needed were transferred and incubated for ~48 hours.</p>	<p>OECD recommends that newly hatched larvae are selected that have not yet formed a "C" shape and randomizing the allocation of larvae into the plates for each colony. On Day 1, larva is deposited in cell containing 20 µL diet.</p>
<b>Bees randomly or impartially assigned to test groups</b>	Yes, larvae were indiscriminately selected per treatment level, and well plates were indiscriminately placed on shelves within the desiccator.	<p>OECD recommends that each group of a minimum of 12 larvae from each of the three colonies is considered a replicate for a given treatment level and identified as such on the microplate.</p>
<b>Control</b>	Untreated diet; 36 negative control larvae.	<p>OECD recommends 12 larvae x 3 colonies=36 larvae minimum and that control mortality from D4 to D7 should be ≤15%.</p>
<b>Solvent control</b>	N/A	<p>OECD recommends maximum of 5%.</p>
<b>Reference Toxicant</b>	Dimethoate, tested at a nominal concentration of 257 mg ai/kg (8.8 µg ai/larva). 36 reference larvae	<p>OECD recommends technical</p>

Guideline Criteria	Reported Information	Comments
	exposed.	<i>grade dimethoate at dose of <math>8.8 \pm 0.5 \mu\text{g a.i./larva}</math>. Mortality should be <math>\geq 50\%</math> at D7 for toxic reference.</i>
<b>Total observation period and frequency of interim observations</b>	Larvae were observed daily at the time of feeding. Final observations were recorded approximately 72 hours after dosing. Observations of sublethal effects, including the presence of uneaten food were recorded on Day 7.	<i>OECD recommends that following chemical exposure on D4, mortalities are checked at time of feeding on D5, D6 and D7 (test termination). Other observations including presence of uneaten food on D7 should be qualitatively reported.</i>

## 12. REPORTED RESULTS

Guideline Criteria	Reported Information
<b>Quality assurance and GLP compliance statements were included in the report?</b>	Yes, signed and dated statements of No Data Confidentiality, Quality Assurance, and Good Laboratory Practice Compliance were provided. This study was conducted in compliance with the GLP standards as published by the U.S. EPA (40 CFR Parts 160, 1989) and the OECD principles of GLP (ENV/MC/CHEM (98)17) with the following exceptions: periodic analyses of water, fructose, glucose, yeast extract, and royal jelly for potential contaminants; the characterization and stability of the test and reference substance in the dose solutions; and the stability, homogeneity, and verification of the reference substance in the dose solutions.
<b>Observed adverse effects on bees at respective dosages</b>	On Day 7, unconsumed diet was noted in 3, 0, 6, 13, 71, and 100% of surviving bees in the negative control and measured 6.19, 12.3, 24.5, 49.2, and 98.2 $\mu\text{g ai/larva}$ treatment

Guideline Criteria	Reported Information
	groups, respectively.
<b>Control and Solvent Control Mortality</b>	Negative control: 0%
<b>Were raw data included?</b>	Yes. Except environmental conditions.
<b>Analytical Analysis?</b>	Yes, conducted using in-house using methods developed by Eurofins-Easton. Larval Diet C samples were analyzed using high performance liquid chromatography with tandem mass spectrometric detection (LC/MS/MS).  LOQ: 31.8 mg ai/kg diet

**Mortality and Observations:**

After 72 hours, there was an absence of mortality in the negative control and lowest test level. Mortality ranged from 3 to 97% in the four highest test levels, with mortality increasing with each test level. On Day 7, unconsumed diet was noted in 3, 0, 6, 13, 71, and 100% of surviving bees in the negative control and measured 6.19, 12.3, 24.5, 49.2, and 98.2 µg ai/larva treatment groups, respectively. Mortality in the positive control (Dimethoate) was 61% at test termination.

**Table 1. Cumulative honey bee larval mortality data after single dietary exposure (dose).**

Mean-Measured Dietary Concentration (Measured Dose)	Number Exposed	Day 5 <sup>a</sup> (%)	Day 6 <sup>a</sup> (%)	Day 7 <sup>b</sup> (%)
Negative Control	36	0	0	0
181 mg ai/kg diet (6.19 µg ai/larva)	36	0	0	0
359 mg ai/kg diet (12.3 µg ai/larva)	36	0	3	3
716 mg ai/kg diet (24.5 µg ai/larva)	36	3	3	11*
1438 mg ai/kg diet (49.2 µg ai/larva)	36	17	39	53*
2871 mg ai/kg diet (98.2 µg ai/larva)	36	39	94	97*
Dimethoate (nominal) 257 mg ai/kg diet (8.8 µg ai/larva)	36	--	--	61

<sup>a</sup> Calculated by the reviewer in Excel using data from Appendix 6, p. 51 of the MRID.

<sup>b</sup> Data obtained from Table 2, p. 18 of the MRID.

--Not calculated.

\*Statistically significant based on study author's results (Jonckheere-Terpstra Step-Down Test,  $p < 0.05$ )

### **Reported Statistics:**

Data were assessed for normality and homogeneity of variance. Comparisons of treatment and negative control responses were performed using a Jonckheere-Terpstra Step-Down Test ( $p < 0.05$ ). The 72-hour LC/LD<sub>50</sub> with confidence limits was estimated by linear interpolation. All statistical analyses were performed using CETIS version 1.9.3.0. The study author reported the following based on the nominal concentrations and nominal doses:

NOAEC: 366 mg ai/kg diet

LOAEC: 732 mg ai/kg diet

LC<sub>50</sub>: 1394 mg ai/kg diet      95% C.I.: 695.7 - 2289 mg ai/kg diet

DP Barcode: 459470

MRID No.: 51159001

NOAEL: 13 µg ai/larva

LOAEL: 25 µg ai/larva

LD<sub>50</sub>: 47.8 µg ai/larva      95% C.I.: 23.8 - 86.1 µg ai/larva

### **Reviewer's Statistical Analysis:**

Mortality data were analyzed using CETIS statistical software version 1.9.6.12 with database backend settings implemented by EFED on 7/25/17. Measured diet concentrations (mg ai/kg diet) and measured dietary doses (µg ai/larva) were used for the analyses and are represented in CETIS as separate test records (acronyms "dc" = diet concentration, and "dd" = dietary dose).

Treatment group mortality data were corrected for negative control mortality using Abbott's correction. The LC/LD<sub>50</sub> values with 95% confidence intervals were determined using linear regression.

	<b>Mortality</b>
Diet Concentration (mg ai/kg diet)	LC <sub>50</sub> : 1316 95% CI: 1127 - 1528 Slope: 5 (3 - 6)
Dietary Dose (µg ai/larva)	LD <sub>50</sub> : 45.0 95% CI: 38.5 - 52.3 Slope: 4.8 (3.4 - 6.3)

### **13. REVIEWER'S COMMENTS:**

The reviewer's LC/LD<sub>50</sub> results were lower than the study author's. Differences can be attributed to the reviewer using linear regression results based on the measured concentrations and doses, compared to the study author using linear interpolation results based on the slightly higher values of the nominal concentrations and doses. The reviewer's results are presented in the Conclusions section of this DER, because measured concentrations/doses are the most accurate quantification of exposure.

The following validity criteria were met for the guideline followed:

- 1) Larval mortality from D4 to D7 in the control replicates was ≤15%.
- 2) In the reference chemical treatment, larval mortality should be ≥ 50% at D7.

The in-life phase of this study was conducted between July 1 and July 7, 2019.
